HACKYEAH 2026 · SUPERTEAM POLAND

Bestcrow

Crowdfunding for startups where money releases by rule, not by a Kickstarter-style operator.

Anchor program · **Backer-weighted votes** · **Pro-rata refunds**

PROBLEM · WHO IT HURTS

Two people who don't know each other, and a platform both must trust

The creator

Needs capital before the product exists, but must use a platform that controls the campaign and payout flow.

The backer

Funds a stranger and risks losing control after the goal is reached. A failed project may leave no simple path to a refund.

Named users: **early-stage startup and prototype teams** and the backers funding them.

Milestones reduce backer risk because the full budget does not leave the vault at once.

The operator profits twice: an **upfront platform cut** (typically a few percent of the raise plus payment processing) and **control** — it can freeze or reject a campaign and decides when the creator is paid.

THE INTERMEDIARY, NAMED · DESIGN RATIONALE

The operator is custody plus discretionary payout

Before: Kickstarter-style

The platform holds the pledges, controls the payout flow and becomes the trusted intermediary for every failure case.

After: Bestcrow

The program holds funds, locks the schedule, gates later releases by backer votes and exposes individual refunds.

Why not a database? A DB admin can edit state and still controls the payout rails. Here the rule — not an operator — is the source of truth, and neither party can bypass it.

HOW IT WORKS · PART 1

Terms are locked before the first pledge

Create draft → **Add 2–5 tranches (≤50% each, =100%)** → **Seal & open funding**

- Funding window **7–183 days**; overfunding allowed — no cap at the goal.
- Each tranche's share, work period and recipients are fixed; no post-start edits.
- The MVP requires **no creator deposit**. Anti-bot measures come later.

HOW IT WORKS · PART 2

Backers approve each release — the rule decides

Evidence → 7-day vote

Weight = final pledge. Approval needs **>50%** of all contributions. Exactly 50% or no votes = no.

One revision, then stop

First failure opens **30 days** to improve, then a second 7-day vote. Second failure → termination.

An approved tranche is payable **exactly once** to a fixed recipient. Anyone may trigger the technical release once the rule is satisfied.

HOW IT WORKS · FAILURE IS FIRST-CLASS

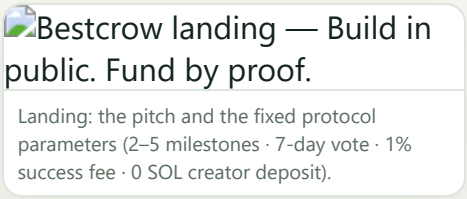

Every failure path is permissionless and pro-rata

- **Missed goal:** no fee; each backer claims 100% of their own pledge.
- **Termination:** the remaining pool is frozen and refunded proportionally to frozen pledge weight.
- **Double-claim guard:** refunds/releases are exactly-once; a closed ledger can't be replayed.
- **Anyone can submit** an eligible finalize/refund transaction — a timer never moves money by itself.

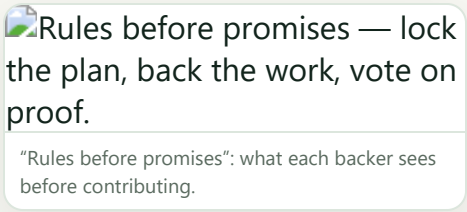

If a party disappears: the goal simply misses and refunds open; a rejected milestone terminates and refunds; approved tranches stay claimable. **No single party can lock the money.**

PROOF, NOT A MOCKUP · THE APPLICATION

Click-through flow — rules, funding, wallet, profile

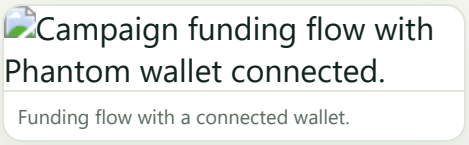

Landing: the pitch and the fixed protocol parameters (2–5 milestones · 7-day vote · 1% success fee · 0 SOL creator deposit).

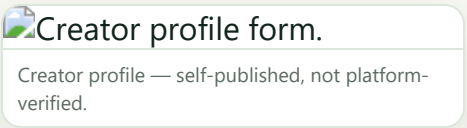

“Rules before promises”: what each backer sees before contributing.

PROTOTYPE · DEPLOYMENT READY

Built to connect to Devnet once V2 is confirmed

Funding flow with a connected wallet.

Creator profile — self-published, not platform-verified.

The repository includes deployment, configuration and smoke-test scripts. Final V2 transaction links will be added after deployment verification.

Target MVP Anchor program, generated IDL and guarded Devnet workflow in the repository.
Local demo `docker compose up --build` starts the web app and API.

WHAT IS TRUE TODAY

What the program does — and the one honest limit

Enforced on-chain

Fixed goal, deadline and recipients · program-owned vault · permissionless finalization and refunds · exactly-once releases · disclosed upgrade authority.

The honest limit

The program enforces **money**, not worthiness or delivery. Backer votes express approval, not product quality. Previously paid funds can't be clawed back. Upgrade authority is disclosed, not hidden.

WHY THIS WINS · WHAT'S NEXT

Rule-enforced custody — and a roadmap that keeps the trust honest

Why it maps to the brief

Relevance: Kickstarter-style custody and payout discretion move into fixed on-chain rules. **Completeness:** a usable click-through prototype and local tests. **Idea:** milestone funding lowers backer risk. **Implementation:** Anchor + tests + client. **Originality:** a tokenless conditional vault.

Next

Confirm V2 on Devnet, run the adversarial test matrix, add durable terms and evidence storage, then pilot with a real prototype team.
